

Week 4 Progress Report

Document Intelligence System

Overview

This week, I worked on creating thresholds in my code to remove noise, stains, and other background artifacts from my files. In addition, I updated my code to filter all data and determine which files were image, medium, or OCR-ready. The filtering specifically checked whether the PDF contained images. Image files contain many pictures, medium files contain only a small number of images, and OCR-ready files contain no images. Following this, I began creating my training dataset by using Label Studio to label the data.

What I Got Done

Data Processing

- Removing noise from pdf files.
- Separating files into image, medium, and ocr ready folders for better understanding.
- Data labeling for training in Label Studio.

Problems

The main problem I faced this week was determining the proper threshold level to remove noise and dust from PDFs without removing the text itself.

What's Next

My next step is to continue labeling the data for training. I expect this process to take some time.
